

HelioDesk Reliability Review

Q2 2026 | Fictional operational report for the GraphMind sample corpus

REPORT OWNER	REVIEW WINDOW	STATUS
Site Reliability	2026-04-01 to 2026-06-30	Approved for demo

Executive summary

HelioDesk met its 99.95 percent customer-search availability objective in Q2. Availability was 99.97 percent and p95 answer latency was 2.1 seconds. One severity-one incident, HD-2026-04-17, caused elevated Gateway errors for 28 minutes. No tenant boundary or audit-retention control failed.

Metric	Target	Measured	Result
Search availability	99.95%	99.97%	Met
p95 answer latency	<= 2.5 sec	2.1 sec	Met
Audit event delivery	100%	100%	Met
Severity-one incidents	<= 1	1	Met

Key conclusion

The April remediation changed Gateway cache configuration and added a canary check for tenant-route mappings. After the change, monthly p95 latency improved from 2.8 seconds in April to 2.1 seconds for the quarter-end measurement window.

Incident HD-2026-04-17

At 14:06 UTC on 2026-04-17, a Gateway configuration rollout caused stale tenant-route entries to remain in one cache shard. Requests were rejected safely with HTTP 503 responses; they were not routed to another tenant. Customer-search error rate peaked at 18 percent.

UTC	Event	Owner
14:06	Alert detected elevated Gateway 503 responses.	Platform Team
14:12	Incident commander paused the rollout and enabled the prior configuration.	Priya Rao
14:19	Cache shards were flushed; error rate began to recover.	Platform Team
14:34	Search availability returned to normal; monitoring continued.	Incident commander
15:05	Trust Team confirmed complete audit delivery and no cross-tenant access.	Elena Ortiz

Root cause

The rollout validator checked the configuration file but did not verify that every cache shard had loaded the new tenant-route version. A retry loop then preserved stale entries longer than intended. The safe rejection policy prevented incorrect routing, but availability dropped until the cache flush.

Corrective actions

Action	Owner	Due	Status
Add shard-version canary before traffic shift	Platform Team	2026-04-24	Complete
Cap stale-route retry at two minutes	Platform Team	2026-04-24	Complete
Add tenant-route rejection exercise to quarterly game day	Trust Team	2026-06-15	Complete
Expose cache-version skew on the operations dashboard	SRE	2026-05-10	Complete

Reliability priorities for Q3

The review board prioritized controls that preserve useful degraded service and make evidence gaps explicit. Work is ordered by customer impact and control value, not by feature visibility.

Priority	Outcome	Measure
1. Graph fallback	Search stays available when Neo4j is offline.	Monthly failure-injection test passes
2. Audit buffering	Producers preserve event IDs during a 15-minute outage.	100% replay with no duplicate records
3. Source deletion	Deleted sources disappear from canonical, vector, and graph indexes.	Deletion verification completes within 24 hours
4. Capacity alerts	Teams see Gateway or Retrieval Engine saturation before latency breaches.	Alert at 70% sustained utilization

Ownership and review cadence

Priya Rao owns Gateway reliability, Elena Ortiz owns audit-control verification, and the Search Team owns Retrieval Engine and Knowledge Index capacity. The reliability board reviews these measures on the first Tuesday of each month. Any missed objective receives an owner and due date in the same review.

Interpretation note

All organizations, people, incidents, metrics, and dates in this report are synthetic. The report is designed to exercise PDF parsing, citations, exact fact retrieval, and synthesis with the other HelioDesk sample files.
